

# PHP/MySQL Project

## Due: Monday, 08/06/12, 11:59pm

1. (75 pts) Finish creating your html and php pages for your real-world application. Implement the functionalities that you have defined for your application, as well as the ability to query your ONID database using your web forms. You're graded on your **website containing complex queries** that use joins and selections, rather than using simple queries for the database and doing the manipulation within the php code. In addition to the database interaction, your website is graded on **user friendliness with good functionality** and **adhering to the project description** and user requirements. Since we will not be able to view the source code in your php pages, then you need to create a zip file containing your .php files.
2. (25 pts) Update your design document from Assignment #5 with any changes. This includes new screen shots of your user interface, new questions you are answering, etc. Please remember to provide your partner's name, if you are working on a group project. In addition, provide the location of your website, and any **special instructions for using your real-world application**, such as administrator usernames and passwords. At this point, you should have **all sections of the document complete**, including any future work that you were unable to implement. Now, add this to your zip file that contains your php code.
3. You will turn in a zip file containing your document and php source code through TEACH.
